EDUCATION

St. John's University

Queens, NY

Bachelor's of Science in Computer Science, GPA: 3.76 | Cum Laude

Aug 2022 – May 2026

- 3rd Place, St. John's Hacks (Toltiq Track)
- Coursework: Data Structures & Algorithms, OOP, SQL, Web Development, Operating Systems

PROJECTS

ADAPT AI | *Next.js, TypeScript, React, OpenAI GPT-4, Office.js, Tailwind CSS*

Feb 2026

- Built an AI-powered PowerPoint add-in delivering real-time executive insights, speaker notes, and research suggestions directly within PowerPoint via Office.js, with a responsive UI built on the Next.js App Router
- Engineered a REST API endpoint using Next.js App Router to handle audio transcription and slide content analysis, enabling voice-driven slide generation via Whisper + GPT-4
- Persisted presentation insights using localStorage and Office.js across Mac and Windows with multi-layered fallback strategies, achieving zero feature degradation across both platforms
- Exported curated notes in 3 formats (PDF, Word, Excel) using jsPDF, docx, and xlsx, eliminating post-meeting manual copy-paste workflows for end users

UptimeChecker | *Next.js, TypeScript, Supabase, Stripe, Redis/QStash, Vercel*

April 2026

- Built a real-time monitoring dashboard in Next.js and TypeScript centralizing health analytics and incident tracking across 20+ services, with a multi-channel alerting UI spanning email, Slack, Discord, and Teams
- Automated uptime monitoring using Next.js API routes, Supabase, and QStash on 1-14 day intervals, logging latency, status codes, and 1KB response samples per service for downtime analysis
- Enforced 1 ping per service every 30 seconds using Upstash Redis and Supabase queues, delivering incidents across 4 channels via Resend webhooks to eliminate duplicate notifications

PlanVoy | *React, FastAPI, PostgreSQL, Redis, OpenAI GPT-4o, Docker*

May 2026

- Designed a GPT-4o prompt engineering pipeline with schema-constrained JSON outputs, enabling reliable generation of long-form, structured itinerary data (4K+ tokens) across recommendations, logistics, and contextual travel guidance
- Implemented Redis caching with SHA-256 hashed keys, reducing GPT-4o response times from 4s to under 50ms for cache-hit queries
- Offloaded itinerary email delivery to FastAPI background tasks, reducing API response time by 97% (from synchronous SMTP blocking to an immediate HTTP 202) while maintaining reliable async delivery via PostgreSQL trip lookups
- Reduced local environment setup from multi-step manual installs to a single command using Docker Compose across 4 containerized services with health checks and volume persistence

VCRTS — Vehicular Cloud Real-Time System | *Java, Swing, MySQL*

Dec 2025

- Architected a distributed Vehicular Cloud Computing platform using a multi-threaded TCP socket server enabling real-time job scheduling across networked idle vehicles
- Implemented a fault-tolerant job recovery system with checkpoint-based state preservation, automatically reassigning interrupted jobs to replacement vehicles with zero data loss
- Reduced scheduling conflicts to zero using a Java FIFO queue with configurable redundancy levels, surfaced across 3 role-based Swing GUIs built on an MVC architecture
- Eliminated cold-start data loss using MySQL and a dedicated DatabaseManager handling CRUD operations for 4 entity types, automatically restoring full application state on every startup

TECHNICAL SKILLS

Languages: Java, Python, Typescript, JavaScript, HTML/CSS

Frameworks: Next.js, React, Node.js, FastAPI, Tailwind CSS

Developer Tools: Git, Github, VS Code, PyCharm, Eclipse, Vercel, Docker

Databases: PostgreSQL, MySQL, Redis, Supabase

Libraries: React query, pandas, NumPy, openAI
